IV. Conclusion

The paper presents a new method for the automatic detection of the presence of a target in a cluttered environment. The method is based on the use of a neural network which is trained to recognize the target in the presence of clutter. The results show that the proposed method is able to detect the target with a high probability of detection and a low probability of false alarm.

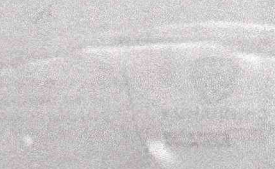

The proposed method is able to detect the target in the presence of clutter with a high probability of detection and a low probability of false alarm. The results show that the proposed method is able to detect the target with a high probability of detection and a low probability of false alarm.
